Renewable Energy Solutions for

ABOUT CARLO GAVAZZI

Carlo Gavazzi Automation is an international group active in designing, manufacturing and marketing electronic equipment targeted at the global markets of industrial and building automation.

Our history is full of firsts and our products are installed in a huge number of applications all over the world. With more than 80 years of successful operation, our experience is unparalleled.

We have our headquarters in Europe and numerous offices around the world.

Our R&D competence centres and production sites are located in Denmark, Italy, Lithuania, Malta and the People’s Republic of China.

We operate worldwide through 22 of our own sales companies and also selected representatives in more than 65 countries, from the United States in the West to the Pacific Rim in the East.

Our core competence in automation spans three product lines: Sensors, Switches and Controls.

Our wide array of products includes sensors, monitoring relays, timers, energy management system, solid state relays, safety devices and fieldbus systems.

We focus our expertise on offering state-of-the-art product solutions in selected market segments.

Our customers include original equipment manufacturers of packaging machines, plastic injection moulding machines, food and beverage production machines, conveying and material handling equipment, door and entrance control systems, lifts and escalators, as well as heating, ventilation and airconditioning devices.
DESIGNED TO MEET MARKET REQUIREMENTS

The increasing demand for energy, the availability and cost of oil and issues of pollution make alternative sources of renewable energy essential.

Sun and wind energy can be transformed into electricity that can be used directly or fed into the grid according to national regulations.

Renewable energy, in combination with energy efficiency, is the basis for sustainable development and respect for the environment in which we all live.

Carlo Gavazzi’s wide expertise is focused on developing and offering a package of products and devices for the Renewable Energy market, specifically photovoltaic power plants.

The growing development of cost effective solar energy technology has great potential to benefit our world. Solar technologies diversify the energy supply, reduce our dependence on fossil fuels, improve air quality and offset greenhouse gas emissions.

Carlo Gavazzi offers complete and modular solutions to monitor and control the efficiency of photovoltaic plants.

Our PV monitoring solution consists of Eos-Array, Eos-Web devices, depending upon the requirements and complexity of the photovoltaic plant.

The Eos-Array and Eos-Array Lite are modular systems, providing efficient local string control to the PV plant.

The Eos-Web is a web-server suitable for controlling and supervising small to medium installations as a stand-alone solution.
Renewable Energy

Photovoltaic parks

In terms of scale and accessibility, solar parks represent the most economical option as regards planning and construction. Carlo Gavazzi products ensure an important contribution to the maximum capacity utilization of the solar electricity produced in photovoltaic power plants - both fixed plants or plants with tracking systems, with 1 or 2 axes.

To complement photovoltaic modules, Carlo Gavazzi provides many components for a photovoltaic installation, especially for surge protection and plant monitoring. Systems and devices to monitor and control the efficiency of photovoltaic parks are essential to ensure that the solar investment is a solid and efficient one. The Eos-Web is the ideal solution for installations up to 1 MW. The Eos-Web is a web server gathering data from string monitoring units such as the Eos-Array, inverters and

</table>
energy meters. All plant information is available simply by using the PC web browser and any Internet connection. The Eos-Array is a comprehensive string control system, suitable for being integrated into both Eos-Web based solutions and standard SCADA software packages.

Based on glass optical fibre, the SIUFO is the solution for reliable communication where a traditional RS485 network cannot guarantee the correct level of immunity from electromagnetic emissions from inverters, substations or power wiring. Carlo Gavazzi’s flexible and modular PV monitoring architecture allows all the needs of investors, PV plant installers and maintenance services to be satisfied. Carlo Gavazzi application engineers and product specialists with solid expertise provide complete support, starting from project planning up to start up.
Renewable Energy

Photovoltaic small business, commercial and tracking

Carlo Gavazzi provides everything for PV plant monitoring. Eos-Array and Eos-Array Lite are systems composed of individual modular elements interacting with one another, providing efficient local control to the solar plant and ensuring effective information management in medium or high power plants.

Carlo Gavazzi provides the Eos-Web, where the VMU-C unit is a local web-based data management system which gathers measurements and status information from one or more inverters to your PC or to a centralised cloud monitoring solution based on the Eos-Server. With some rented roofs, wired internet is not available, but VMU-D solves this problem by using diffuse mobile communication.

Carlo Gavazzi energy meters and analyzers measure the energy produced and provided to the grid or locally consumed. These meters can be supplied with MID certification (Annex D).

The energy produced at low voltage by a PV plant can be measured with a MID approved meter such as the EM210, EM24 or EM26.

When supplying energy to the grid, it is necessary to use a protection device installed between the generator and the power grid in order to grant the required voltage and/or frequency control.

Carlo Gavazzi’s interface protections are the most compact solutions currently available on the market.

The PI-DIN protection adds a control function to frequency derivative and event recording and is equipped with a large display for local information readout and a serial port for remote readout.

The surge protecting devices for direct and indirect lightning discharge complete the Carlo Gavazzi portfolio for the photovoltaic market.

The range includes surge protection devices for the protection of DC lines up to 1200 VDC, the mains AC lines and also the serial communication devices.
PV energy is generated during the day, while the user generally consumes it during the evening. To minimise the flow between the plant and the grid, it is worth having an energy storage system on site.

In order to evaluate the amount of energy going through the battery system compared to the quantity sent to the grid, it is necessary to measure the flow in both these 2 directions. The information gathered allows the evaluation of the efficiency and payback of the system, but it is also useful to know the charging status of the battery pack.

Carlo Gavazzi offers two solutions for the energy storage systems for new plants and for retrofitted.

The CPA is the ideal solution for new renewable energy plants and storage systems, thanks to its smart mounting system and a comprehensive set of measurable variables, such as voltage, power, energy, frequency, power factor and THD, available through RS485/Modbus communication.

The EM271 and the relevant TCDxM split core current sensing units are frequently used in energy storage systems both new and retrofitted. The EM271 is able to measure 2 loads in a single meter, allowing for time and space savings.
PV plants in residential areas are mostly grid connected installations. Modules are set on roofs and the energy produced by the PV modules is delivered to the inverters and then fed into the public grid. Carlo Gavazzi offers a wide range of devices and components for the configuration of the electrical solar plant. Separate interface protection can be achieved with our wide range of monitoring relays such as the PI-DIN, DPC and DPC02, according to national norm requirements.

For energy metering you can use the EM1xx single-phase energy meter series or the EM2xx and EM3xx series for 3-phase PV residential system applications, all with LCD data display.

The real-time energy usage measurements, made via our touch screen and data logger SmartHUB, will lead to more efficiency in energy consumption needs, resulting in significant energy savings. The system reads and logs the energy consumption of the whole installation or of a single load. Data can be accessed anytime by means of a web-server/web-app and shown as instantaneous values, or in the form of graphs and/or diagrams.

For protection against surges and overvoltages it is possible to use the DSB or DSF surge arresters for both DC and AC lines. In the case of direct lightning discharge protection, the DSC series can be used.
In remote areas renewable energy systems are gaining popularity, using stand-alone, off-grid plants with or without battery storage. Carlo Gavazzi provides some additional components that can play an important role in such installations.

DSC surge protecting devices provide protection for PV installations where an LPS (Lightning Protection System) is installed, hence subject to direct lightning strikes. This device is Type 1 and Type 2 approved.

DSB and DSF surge protecting devices can be used either on wind turbines or on PV installations. They are available for DC and AC networks and are Type 2, suitable for indirect lightning protection. Wind speed and direction are extremely important parameters. Accurate measurements are necessary to keep the wind turbine structure under control. The Carlo Gavazzi anemometer DWS-V, with opto electronic detection, measures speed from 2 to 30 m/s. The sensor is designed with a dust and humidity seal, which makes the sensor impervious to all weather conditions. The micro-processor-based digital panel meter (UDM60), with its dual 6-dgt LCD indicator, displays the wind speed by measuring the input from the anemometer, while the energy produced is measured by a 3-phase energy analyzer (EM24, EM210, EM330 or EM340).
The VMU-C PV is the core solution for effective Photovoltaic Monitoring in applications of all sizes. It collects measurements from EosArray string control units, energy meters and inverters; it stores information (variables and alarms) in its local database and displays it through its web-based graphical user interface.

The whole system set-up and operation is possible via the VMU-C’s web interface, without any external software. The VMU-C PV can exchange data with other systems by means of standard FTP/HTTP communication.
VMU-C PV’s benefits at a glance

- No crash or compatibility problems due to different operative systems, different languages, libraries, etc.
- Improved IT security
- On-site database
- Application-focused software embedded inside industrial grade hardware: no need for a dedicated PC for monitoring
- Modular solution for additional inputs/outputs
- Polling device, data-logger and Ethernet gateway in a single compact unit
- Optional modular modem for wireless Ethernet connections
Renewable Energy

Our product range

**Eos-Array / Eos-Array Lite**
- Modular local monitoring system for PV plant
- Up to 16 DIN module configuration
- EosArraySoft, freeware configuration software
- EosArray can manage in addition to VMU-L unit up to: 1 VMU-P, up to 15 VMU-S and up to 7 VMU-O for a total of maximum 15 units

**MAIN FEATURES**
- The Eos-Array solution can be composed of: VMU-L master unit and data logger; VMU-S string controller; VMU-P environment variable unit and VMU-O I/O unit
- Eos-Array Lite is the answer to those photovoltaic applications where a less sophisticated monitoring solution is needed

---

**VMU-C PV (Eos-Web)**
- Dimensions: 2 DIN modules
- Micro PC with web server and web service capability
- Data and event logging capability
- Internal 4GB memory and 16GB SDHC card back-up memory (on request)
- Variables shown as graphs and numbers in formatted tables
- All data exports on HTML format
- Management up to 14 Eos-Array, 64 inverters + energy meters

**MAIN FEATURES**
- Efficiency calculation and control on different levels: string, BOS and Performance ratio and Yield indices
- Alarms control with automatic e-mailing and SMS management by means of VMU-C

**VMU-D**
- Dimensions: 2 DIN modules
- Compatible with Carlo Gavazzi approved 3G/4G USB modems
- Power supply: 24 VDC (+/- 20%)
- Suitable for use with VMU-C

**SmartHUB**
- Energy data logging from meters and PV inverters
- Colour touch screen 7" (BTM-T7) and 4.3" (BTM-F4)
- Remote access through web browsers
- Alarms management

**MAIN FEATURES**
- Wide screen display, 64 K colours
- 2 Ethernet port with integrated switch
- SD memory card slot
- USB host port
- Multistandard Modbus RTU serial communication port (selectable: RS485, RS422 or RS232)

---

**1-phase energy analyzers**

- **EM111 / EM112**
  - Dimensions: 1 DIN module (EM111) 2 DIN modules (EM112)
  - Backlit touch LCD
  - Measurement of voltage, current, power, power factor and frequency
  - Measuring inputs: 120 VAC, 230 VAC, 32 A (max 45 A) (EM111)/100 A (EM112)
  - Bi-directional energy metering, 7 digits (EM111) 8 digits (EM112), Class B (EN50470)

**MAIN FEATURES**
- Self-powered
- Pulse output or as an alternative: RS485 Modbus, M-Bus
- Sealable terminal covers
- MID Annex D certification available (230 V)
- CE, UL (120 V)

**EM24**
- Dimensions: 4 DIN modules
- 3-phase energy analyzers with direct connection or by CT
- Primary current input: 5 A
- Class I (kWh) according to EN62053-1
- Class B (kWh) according to EN50470
- Modbus communication port

**MAIN FEATURES**
- Energy analyser in a very compact housing to save space
- Suitable for measuring generated and consumed energy
- MID Annex D certification available

---

**3-phase energy analyzers**

- **EM26**
  - Dimensions: 96 x 96 mm housing, only 45 mm behind the panel
  - 3-phase energy meters with CT/VT connection
  - Primary current input: 5 A
  - Class I (kWh) according to EN62053-1
  - Class B (kWh) according to EN50470
  - Modbus communication port

**MAIN FEATURES**
- Direct or external CT measurement in a very compact housing to save space
- Suitable for measuring generated and consumed energy
- MID Annex D certification available

**EM330 / EM340**
- Dimensions: 3 DIN modules
- Backlit touch LCD
- Measurement of voltage, current, power, power factor and frequency
- Bi-directional energy metering on 2 8-digit counters, Class B (EN50470)
- Measuring inputs: 3 x 230 (400) VAC, 5 A (EM330); 65 A (EM340)
- Pulse open collector output
- Modbus, RTU, Modbus Ethernet or M-Bus communication port

**MAIN FEATURES**
- Pulse output or as an alternative: RS485 Modbus, M-Bus
- Sealable terminal covers
- CE approved and MID Annex D certification available
- cULus approved up to 480 VAC (EM330)
